G. M. Butler's "Handbook of Blowpipe Analysis" gives the following explanations of the flames made with the aid of the blowpipe and the directions for producing them. Blowpipe Operations. "The blowpipe is used for the purpose of concentrating the flame into a long, slender cone which can be readily directed against the substance to be heated.

Blowpipe (tool) - Wikipedia

Blowpipe analysis refers to the series of physical and chemical tests made using the flame of a blowpipe. The blowpipe is a metal tube about 25 cm long, tapering from a diameter of about 8 mm to an orifice of about 0.3 mm at the tip.

In chemistry and mineralogy blowpipes have been used as scientific instruments for the analysis of small samples since about 1738, according to the accounts of Torbern Bergman. One Andreas Swab, a Swedish metallurgist and Counsellor of the College of Mines is credited with the first use of the blowpipe for 'pyrognostic operations', of which no record remains.

The test is sometimes used to identify the metals in minerals. In this case, a mineral-coated bead is heated in a flame and cooled to observe its characteristic color. The bead test may be used on its own in chemical analysis but it's more common to use it in conjunction with the flame test to better identify the composition of the sample.
